

1. Deploy your previous assignment flask frontend and express backend in kubernetes cluster locally with minikube.

Data Received by Flask Backend

Name: Test User

Email: testuser@test.com

The screenshot displays the Kubernetes Dashboard web interface. The browser's address bar shows the URL `http://127.0.0.1:42903/api/v1/namespaces/kubernetes-dashboard/services/http:kubernetes-dashboard/proxy/https://workloads.tutefude.de`. The dashboard's left sidebar is visible, with 'Workloads' selected. The main panel shows the 'Workload Status' section, which includes three large green circles representing the status of Deployments, Pods, and Replica Sets, each indicating 'Running: 2'. Below this, the 'Deployments' table is shown, listing two deployments: 'frontend-deployment' and 'backend', both with 1/1 pods and created within the last 5 minutes.

Name	Images	Labels	Pods	Created
frontend-deployment	aadityaa173/tutefude_devops:frontend01	-	1 / 1	4 minutes ago
backend	aadityaa173/tutefude_devops:backend01	-	1 / 1	5 minutes ago
